Euler's formula

$$e^{j\theta} = \cos(\theta) + j\sin(\theta)$$

$$e^{-j\theta} = \cos(\theta) - j\sin(\theta)$$

Chapter 1

1.2.2 Bounded signals

x(t) is bounded if

 $\exists M [(0 < M < \infty) \land (\forall t | x(t) | < M)]$

(got upper n lower range limit)

1.2.3 Absolutely integrable signals

x(t) is absolutely integrable if

$$\int_{-\infty}^{\infty} |x(t)| dt < \infty$$

1.2.6 Energy and Power Signals Energy signals

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt \tag{1.3a}$$

$$x(t)$$
 is an energy signal $\iff 0 < E < \infty$ (1.3b)

Power signals

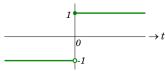

$$P = \lim_{\tau \to \infty} \frac{1}{2\tau} \int_{-\tau}^{\tau} |x(t)|^2 dt \qquad (1.4a) \quad \frac{\text{Chapter 2}}{\text{2.1 Timed}}$$

$$x(t)$$
 is a power signal $\iff 0 < P < \infty$ (1.4b) **2.1.5 Convolution of 2 Signals** If $x(t)$ is a periodic signal, average power may be computed by
$$\frac{1}{T} \int_0^T |x(t)|^2 dt$$
 Properties of Dirac. $\delta(t) = \delta(-t)$

- Energy signals have 0 average power, bc E = finite 2. Sampling:
- Power signals have infinite total energy, bc P = finite 3. Sifting implies $E = \infty$
- · All bounded periodic signals are power signals u(t):

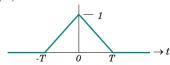

sgn(t):

 $\mathbf{rect}\left(\frac{t}{T}\right)$:

 $\operatorname{tri}\left(\frac{t}{T}\right)$:

 $\operatorname{sinc}\left(\frac{t}{T}\right)$:

 $e^{-\alpha t}u(t)$:

 $e^{-\alpha|t|}$.

2.1 Time-domain Operations

$$x(t) * y(t) = \int_{-\infty}^{\infty} x(\alpha)y(t-\alpha) d\alpha$$

Properties of Dirac-
$$\delta$$
:

- Symmetry:

$$x(t)\delta(t-\lambda) = x(\lambda)\delta(t-\lambda)$$

$$\int_{-\infty}^{\infty} x(t)\delta(t-\lambda)dt = x(\lambda)$$

4. Replication

$$x(t) * \delta(t - \lambda) = x(t - \lambda)$$

Convolution with Dirac-
$$\delta$$
 Comb function $x_p(t) = x(t) * \sum_n \delta(t - nT)$

Multiplication with the Dirac- δ Comb function

$$x_s(t) = x(t) \times \sum_n \delta(t - nT)$$

$$= \sum_n x(t) \times \delta(t - nT)$$

$$= \sum_n x(nT)\delta(t - nT)$$

Chapter 3

3.2 Spectrum of a Sinusoid

Spectrum of a Complex Exponential Signal
$$\tilde{x}(t) = \mu e^{j(2\pi f_0 t + \phi)} = \mu e^{j\phi} \times e^{j2\pi f_0 t},$$

Spectrum of a Cosine Signal

$$\mu \cos(2\pi f_0 t + \phi)$$

$$= \frac{\mu}{2} e^{j\phi} e^{j2\pi f_0 t} + \frac{\mu}{2} e^{j(-\phi)} e^{j2\pi(-f_0)t}$$

Spectrum of a Sine Signal
$$\mu \sin(2\pi f_0 t + \phi) = \frac{\mu}{2} e^{j(\phi - 0.5\pi)} e^{j2\pi f_0 t}$$

$$+ \frac{\mu}{2} e^{j(-\phi + 0.5\pi)} e^{j2\pi(-f_0)t}$$

Complex exponential Fourier Series

$$x_p(t) = \sum_{k=-\infty}^{\infty} c_k e^{j2\pi kt/T_p}$$
$$= \sum_{k=-\infty}^{\infty} c_k e^{j2\pi kf_p t}$$
(3.1a)

$$c_k = \frac{1}{T_p} \int_{t_0}^{t_0 + T_p} x_p(t) e^{-j2\pi kt/T_p} dt, k \in \mathbb{Z}$$

Trigonometric Fourier Series

$$x_p(t) = a_0 + 2\sum_{k=1}^{\infty} [a_k \cos(2\pi kt/T_p)]$$

$$+b_k\sin(2\pi kt/T_p)]$$

$$a_k = \frac{1}{T_p} \int_{t_0}^{t_0 + T_p} x_p(t) \cos(2\pi k t/T_p) dt; k \ge 0$$

$$b_k = \frac{1}{T_p} \int_{t_0}^{t_0 + T_p} x_p(t) \sin(2\pi k t/T_p) dt; k > 0 \quad \text{Sine}$$

Chapter 4

4.1 Fourier Transform

Forward Fourier Transform

$$X(f) = \int_{-\infty}^{\infty} x(t)e^{-j2\pi ft} dt$$
 (4.1a)

Inverse Fourier Transform
$$x(t) = \int_{-\infty}^{\infty} X(f)e^{j2\pi ft} df \qquad (4.1b)$$

Spectrum of exponentially decaying pulse $x(t) = Ae^{-\alpha t}u(t)$

Assume
$$\alpha > 0$$

$$X(f) = \frac{A}{\alpha + j2\pi f}$$

(2.3) 4.3 Spectral properties of a REAL signal

- If x(t) is **REAL** $(x^*(t) = x(t))$, then
- X(f) is conjugate symmetric $(X^*(f) = X(f))$
- |X(f)| is even (|X(f)| = |X(-f)|)
- $\angle X(f)$ is odd $(\angle X(f) = -\angle X(-f))$
- If x(t) is **REAL** and **EVEN** $(x^*(t) = x(t) \wedge$ x(-t) = x(t), then
- X(f) is real $(X^*f = X(f))$
- X(f) is even (X(-f) = X(f))
- If x(t) is **REAL** and **ODD** $(x^*(t) = x(t) \land x(-t) =$ -x(t)), then
- X(f) is imaginary $(X^*(f) = -X(f))$ - X(f) is odd (X(-f) = -X(f))

The above can apply to Fourier series coefficients of periodic signals too:

- $x_p(t)$ is **REAL**
- c_k is conjugate symmetric $(c_k^* = c_{-k})$
- $|c_k|$ has even symmetry $(|c_k| = |c_{-k}|)$
- $\angle c_k$ has odd symmetry ($\angle c_k = -\angle c_{-k}$)
- $x_p(t)$ is **REAL** and **EVEN**
- c_k is real $(c_k^* = c_k)$
- c_k is even $(c_k = c_{-k})$
- $x_n(t)$ is **REAL** and **ODD**
- c_k is imaginary $(c_k^* = -c_k)$
- c_k is odd $(c_k = -c_{-k})$

4.4 Spectrum of Signals that are not Absolutely In-

$$\Im\{K\delta(t)\} = \int_{-\infty}^{\infty} K\delta(t)e^{-j2\pi ft}dt = K \quad (4.13)$$

4.4.1 Spectrm of Unit Step and Signum function

$$\Im\{u(t)\} = \frac{1}{j2\pi f} + \frac{1}{2}\delta(f)$$
$$\Im\{\operatorname{Sgn}(t)\} = \frac{1}{j\pi f}$$

4.4.2 Continuous-Frequency Spectrum of Periodic Signals

(3.1a) The following make use of the fact that

$$x_{dc}(t) = K 2. P_x$$

 $X_{dc}(f) = \Im\{k\} = K\Im\{1\} = K\delta(f)$

Complex Exponential

$$\tilde{x}(t) = Ke^{j2\pi f_0 t}$$

$$\tilde{X}(f) = \Im\{Ke^{j2\pi f_0 t}\} = K\delta(f - f_0)$$

$$\Im\{K\cos(2\pi f_0 t)\}\$$

$$=\frac{K}{2}\delta(f-f_0) + \frac{K}{2}\delta(f+f_0)$$

$$\begin{split} &\Im\{K\sin(2\pi f_0t)\}\\ &=\frac{K}{j2}\delta(f-f_0)-\frac{K}{j2}\delta(f+f_0)\\ &\left\{|X_s(f)|\right. \\ &\left.=\frac{K}{2}\delta(f-f_0)\right.\\ &\left.+\frac{K}{2}\delta(f+f_0)\right. \end{split}$$

where

$$\begin{cases} \angle X_s(f) &= \begin{cases} -\pi/2, & f = f_0 \\ \pi/2, & f = -f_0 \end{cases} \end{cases}$$

Arbitrary periodic signals

Let $x_p(t)$ be a periodic signal with period T_p and fundamental frequency f_p

$$X_p(f) = \sum_{k=-\infty}^{\infty} c_k \delta(f - kf_p)$$
 (4.16)

4.4.2.1 Spectrum of Dirac- δ Comb function

$$\begin{aligned} \cosh_{\lambda}(t) &\triangleq \sum_{n} \delta(t - n\lambda) \\ c_{k} &= \frac{1}{\lambda} \\ \Im\{ \mathrm{comb}_{\lambda}(t) \} &= \mathrm{COMB}_{\lambda}(f) \\ &= \frac{1}{\lambda} \sum_{k} \delta(f - k/\lambda) \end{aligned}$$

Chapter 5

5.1 Energy Spectral Density (ESD)

Total energy of a signal x(t) is defined as

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt \text{ (Joules)}$$
 (5.1)

E =
$$\int_{-\infty}^{\infty} |x(t)|^2 dt = \int_{-\infty}^{\infty} |X(f)|^2 df, \quad (8)$$

Energy Spectral Density

Spectral Density
$$E_x(f) = |X(f)|^2 \text{ Joules Hz}^{-1}$$
(5.3)

Properties of $E_x(f)$

- 1. $E_x(f)$ is a real function of f
- 2. $E_x(f) \geq 0 \quad \forall f$
- 3. $E_x(f)$ is an even function of f if x(t) is real.

5.2 Power Spectral Density (PSD)

In the time-domain, the average power of a signal x(t) is

$$P = \lim_{\tau \to \infty} \frac{1}{2\tau} \int_{-\tau}^{\tau} |x(t)|^2 dt \qquad (8)$$

Windowed version of x(t):

ersion of
$$x(t)$$
:
$$x_W(t) = x(t)\operatorname{rect}\left(\frac{t}{2W}\right) \tag{5.5}$$

Parseval Power Theorem
$$P = \lim_{W \to \infty} \frac{1}{2W} \int_{-W}^{W} |x(t)|^{2} dt$$

$$= \int_{-\infty}^{\infty} \lim_{W \to \infty} \frac{1}{2W} |X_{W}(f)|^{2} df \qquad (5.9)$$

Power Spectral Density

$$P_x(f) = \lim_{W \to \infty} \frac{1}{2W} |X_W(f)|^2 \text{ Watts Hz}^{-1}$$
(5.10)

Properties of $P_x(f)$

- 1. $P_x(f)$ is a real function of f
- 2. $P_x(f) > 0 \quad \forall f$
- 3. $P_x(f)$ is an even function of f if x(t) is real.

5.2.1 PSD of Periodic Signals

From chapter 4 equation 4.16:

$$X_p(f) = \sum_{k=-\infty}^{\infty} c_k \delta(f - kf_p)$$

$$P_x(f) = \sum_{k=-\infty}^{\infty} |c_k|^2 \delta(f - kf_p)$$
 (5.12)

Average power of $x_p(t)$

$$P = \int_{-\infty}^{\infty} P_x(f)df = \sum_{k=-\infty}^{\infty} |c_k|^2$$
 (5.1)

5.3.1 Bandlimited Signals

Bandpass signal

5.3.2 Signals with Unrestricted Band 5.3.2.1 3dB Bandwidth

Lowpass signal:

5.3.2.2 1st-null Bandwidth

(5.4) 5.3.2.3 M% Energy Containment Bandwidth

Smallest bandwidth that contains at least M% of the total signal energy $E = \int_{-\infty}^{\infty} E_x(f) df$

Bandpass:

5.3.2.4 M% Power Containment Bandwidth

The smallest bandwidth that contains at least M% of the Chapter 7 average signal power. For a periodic signal, the aerage 7.1 Impulse Response

$$P = \int_{-\infty}^{\infty} P_x(f)df = \sum_{k=-\infty}^{\infty} |c_k|^2$$

where $f_p(Hz)$ is the fundamental frequency and c_k 's are the Fourier series coefficients. $P_x(f) = \sum_{k=0}^{\infty} |c_k|^2 \delta(f - kf_p) \uparrow$

where K is the smallest positive integer that satisfies

$$\sum_{k=-k}^{K} |c_k|^2 \ge \frac{M}{100} \times P$$

Chapter 6

6.1 Systems

6.2 Classification of Systems

6.2.1 Systems with Memory and Without Memory

Memoryless: output at a given time is dependent on only the input at that time.

Otherwise, the system has memory / is dynamic.

6.2.2 Causal and Noncausal Systems

Causal (or non-anticipative): Its output, y(t), at the present time depends on only the present and/or past values of its input, x(t).

... not possible for a causal system to produce an output before an input is applied. $\therefore \forall t < 0 \ y(t) = 0$.

6.2.3 Stable and Unstable Systems

BIBO stable (bounded-input/bounded-output): For every bounded input x(t) where

$$\forall t \ |x(t)| < k \tag{6.2}$$

the system produces a bounded output y(t) where $\forall t |y(t)| < L$

in which K and L are positive constants

6.2.4 Linear and Nonlinear Systems

Linear system satisfies the following:

$$\mathbf{T}[\alpha_1 x_1(t) + \alpha_2 x_2(t)]$$

$$= \alpha_1 \mathbf{T}[x_1(t)] + \alpha_2 \mathbf{T}[x_2(t)]$$

$$= \alpha_1 y_1(t) + \alpha_2 y_2(t)$$
(6.6)

(6.6) is known as the superposition property.

Important property of linear systems:

$$x(t) = 0 \implies y(t) = 0$$

6.2.5 Time-Invariant and Time-Varying Systems

Time-invariant: a time shift (delay or advance) in the input signal, x(t), causes the same time shift in the output signal, y(t).

$$T[x(t - \tau)] = y(t - \tau) \tag{6}$$

A time-varying system is one which does not satisfy (6.7). Laplace Transform

ace Transform
$$\tilde{F}(s) = \mathcal{L}\left\{f(t)\right\} = \int_{0}^{\infty} f(t)e^{-st}dt \qquad (6.8)$$

where s is a complex variable

Inverse Laplace Transform

$$f(t) = \mathcal{L}^{-1} \left\{ \tilde{F}(s) \right\} = \frac{1}{2\pi j} \int_{\gamma - j\infty}^{\gamma + j\infty} \tilde{F}(s) ds$$
(6.0)

$$\mathcal{L}\left\{y'''\right\} = s^{2}\mathcal{L}\left\{y\right\} - sy(0) - y'(0)$$

$$\mathcal{L}\left\{y''''\right\} = s^{3}\mathcal{L}\left\{y\right\} - s^{2}y(0) - sy'(0)$$

$$-y''(0)$$

$$\mathcal{L}\left\{y'''''\right\} = s^{4}\mathcal{L}\left\{y\right\} - s^{3}y(0) - s^{2}y'(0)$$

$$-sy''(0) - y'''(0)$$

Impulse response, h(t): The response/output when the input is a unit impulse, $\delta(t)$.

$$\delta(t) \to \text{LTI system} \to h(t)$$

$$h(t) = \mathbf{T}[\delta(t)] \tag{7.3}$$

$$\mathbf{T}[x(t)] = y(t) = x(t) * h(t)$$
 (7.5)

7.1.1 Step Response

Step response: the output of the system when input is unit step function

Step response equals integration of impulse response:
$$o(t) = \int_{-\infty}^{\infty} h(\tau)u(t-\tau)d\tau$$

$$= \int_{-\infty}^{t} h(\tau)d\tau$$
 Step response equals integration of impulse response:
$$o(t) = \int_{-\infty}^{t} h(\tau)d\tau$$

$$J-\infty$$

Impulse response equals differentiation of step response:

$$h(t) = \frac{a}{dt}o(t)$$

7.2 Frequency Response

Frequency response (H(f)): The Fourier transform of $x(t) = A\sin(\omega_o t + \psi) \longrightarrow \tilde{H}(j\omega) \longrightarrow y(t) = A[\tilde{H}(j\omega_o)]\sin(\omega_o t + \psi + \angle \tilde{H}(j\omega_o))$ the system impulse response h(t)

$$H(f) = \Im\{h(t)\} = \int_{-\infty}^{\infty} h(t)e^{-j2\pi ft}dt$$
 (7.6)

$$Y(f) = X(f) \cdot H(f)$$

$$H(f) = |H(f)|e^{j\angle H(f)}$$

$$(7.7)$$

$$(7.8)$$

where |H(f)| is called the magnitude response and $\angle H(f)$ is called the phase response of the system.

7.3 Transfer Function

Transfer function $\tilde{H}(s)$: Laplace transform of h(t)

$$\tilde{H}(s) = \mathcal{L}\left\{h(t)\right\} = \int_0^\infty h(t)e^{-st}dt \tag{7.9}$$

where $s = \sigma + i\omega$ is a complex variable

$$y(t) = x(t) * h(t)$$

$$\tilde{Y}(s) = \tilde{X}(s) \cdot \tilde{H}(s) \tag{7.1}$$

7.4 Relationship between Transfer Function and Frequency Response

Substituting $s = j\omega$ into (7.9), we get

substituting
$$s = j\omega$$
 into (7.9), we get untput $\tilde{H}(s)\Big|_{s=j\omega} = \tilde{H}(j\omega) = \int_0^\infty h(t)e^{-j\omega t}dt$ (7.11)

(6.7) Sub $\omega = 2\pi f$ into (7.11):

Sub
$$\omega = 2\pi f$$
 into (7.11):
$$\left. \tilde{H}(j\omega) \right|_{\omega = 2\pi f} = \int_0^\infty h(t) e^{-j2\pi f t} dt \qquad (7.12)$$
 For causal LTI systems, $\forall t < 0 \ h(t) = 0$. Hence (7.6)

and (7.12) are equivalent.

equivalent.
$$H(f) = \left. \tilde{H}(j\omega) \right|_{\omega = 2\pi f} \tag{7.13}$$

where $|\tilde{H}(j\omega)|$ is called the magnitude response and $\angle \tilde{H}(i\omega)$ is called the phase response of the system.

7.4 Sinusoidal Response at Steady-State

Let system input at steady-state be

$$x(t) = Ae^{j(2\pi f_0 t + \psi)}$$
 (7.15)

$$X(f) = Ae^{j\psi}\delta(f - f_0) \tag{7.16}$$

$$Y(f) = A |H(f_0)| e^{j(\psi + \angle H(f_0))} \delta(f - f_0)$$
 (7.17)

$$y(t) = \Im^{-1} \{Y(f)\}$$

= $A |H(f_0)| e^{j(2\pi f_0 t + \psi + \angle H(f_0))}$ (7.18)

(7.1) System Input :
$$\boxed{A} e^{j(2\pi f_0 t + \psi)}$$

System Output :
$$A|H(f_o)|e^{j(2\pi f_o t + |\psi| + \angle H(f_o))}$$

Steady-state Sinusoidal Response of a LTI System in f-domain

Impulse response equals differentiation of step response:
$$x(t) = Ae^{j(\omega_0 t + \psi)} \longrightarrow \hat{H}(j\omega) \longrightarrow y(t) = A[\hat{H}(j\omega_0)]e^{j(\omega_0 t + \psi + \angle \hat{H}(j\omega_0))}$$

$$h(t) = \frac{d}{dt}o(t)$$

$$x(t) = A\cos(\omega_0 t + \psi) \longrightarrow \hat{H}(j\omega) \longrightarrow y(t) = A[\hat{H}(j\omega_0)]\cos(\omega_0 t + \psi + \angle \hat{H}(j\omega_0))$$
7.2 Frequency Response
Frequency response $(H(f))$: The Fourier transform of
$$x(t) = A\sin(\omega_0 t + \psi) \longrightarrow \hat{H}(j\omega) \longrightarrow y(t) = A[\hat{H}(j\omega_0)]\sin(\omega_0 t + \psi + \angle \hat{H}(j\omega_0))$$

Steady-state Sinusoidal Response of a LTI System in m-domain

(7.7) 7.6 LTI Systems Described by Differential Equations

LTI systems represented by linear constant-coefficient differential equations have the general form

$$\sum_{n=0}^{N} a_n \frac{d^n y(t)}{dt^n} = \sum_{m=0}^{M} b_m \frac{d^m x(t)}{dt^m}$$
 (7.21)

where x(t) is input, y(t) is output, and a_n , b_m are real

7.6.1 Transfer Function

$$\tilde{H}(s) = K \frac{\left(\frac{s}{z_1} + 1\right)\left(\frac{s}{z_2} + 1\right)\cdots\left(\frac{s}{z_M} + 1\right)}{\left(\frac{s}{p_1} + 1\right)\left(\frac{s}{p_2} + 1\right)\cdots\left(\frac{s}{p_N} + 1\right)}$$

$$K = a_0$$

$$\tilde{H}(s) = K' \frac{(s+z_1)(s+z_2)\dots(s+z_M)}{(s+p_1)(s+p_2)\dots(s+p_N)}$$
(7.23c)

$$K = \frac{b_M}{a_N}$$

 $\forall n \in \{1, 2, \dots, N\}$

- $\tilde{H}(-p_n) = \infty$
- $-p_n$ are called **poles** of $\tilde{H}(s)$
- $\forall m \in \{1, 2, \dots, M\}$
- $\tilde{H}(-z_m) = 0$
- $-z_m$ are called **zeros** of $\tilde{H}(s)$

The system is said to have N poles and M zeros, and the difference N-M is called pole-zero excess.

7.6.2 System Stability

BIBO Stable

- · All system poles lying on the left-half s-plane
- h(t) will converge to 0 as t tends to infinity $\lim_{t\to\infty} h(t) = 0$

Marginally Stable

- One or more non-repeated system poles lying on the imaginary axis of the s-plane and no system pole lying 2. $\tilde{H}(s) = K_d s$: differentiator with gain K_d on the right half s-plane.
- neither will it converge to zero as t tends to infinity. $\lim_{t\to\infty} |h(t)| \neq \infty$ and $\lim_{t\to\infty} h(t) \neq 0$

Unstable (Case 1)

· One or more system poles lying on the right-half splane

• h(t) will "blow up" and become unbounded as t tends to infinity

$$\lim_{t\to\infty} |h(t)| = \infty$$

Unstable (Case 2)

- (7.18) One or more repeated system poles lying on the imaginary axis
 - h(t) will "blow up" and become unbounded as t tends to infinity

$\lim_{t\to\infty} |h(t)| = \infty$

7.7 First Order System (Standard Form) 7.7.1 Differential Eqn, Transfer Func, Impulse Response and Step Response

Differential equation:

$$T\frac{dy(t)}{dt} + y(t) = Kx(t)$$
 (7.26)

where

- x(t): system input
- y(t): system output
- K: DC gain
- T: time-constant

$$Ts\tilde{Y}(s) + \tilde{Y}(s) = K\tilde{X}(s)$$

$$\rightarrow \tilde{H}(s) = \frac{\tilde{Y}(s)}{\tilde{X}(s)} = \frac{K}{Ts+1}$$
(7.27)

• Impulse Response h(t) $h(t) = \mathcal{L}^{-1} \left\{ \tilde{H}(s) \right\} = \frac{K}{T} e^{-t/T} u(t)$

o(t) =
$$\int_{-\infty}^{t} h(\tau)d\tau = \mathcal{L}^{-1}\left\{\frac{1}{s}\tilde{H}(s)\right\}$$

= $K\left[1 - e^{-t/T}\right]u(t)$

7.8 Second Order System (Standard Form) 7.8.1 Dif- Asymptotic phase of phase plot ferential Eqn and Transfer Func

· Differential equation:

nherential equation:
$$\frac{d^2y(t)}{dt^2} + 2\zeta\omega_n \frac{dy(t)}{dt} + \omega_n^2 y(t) = K\omega_n^2 x(t)$$

where

- x(t): system input
- y(t): system output C: damping ratio
- ω_n : undamped natural frequency (when $\zeta < 1$)
- K: DC gain

• Transfer function
$$\tilde{H}(s)$$

 $s^2 \tilde{Y}(s) + 2\zeta \omega_n s \tilde{Y}(s) + \omega_-^2 \tilde{Y}(s) = K \omega_-^2 \tilde{X}(s)$

$$\implies \tilde{H}(s) = \frac{\tilde{Y}(s)}{\tilde{X}(s)} = \frac{K\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2}$$

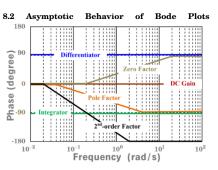

Poles: $s_{1,2} = -\omega_n \zeta \pm \omega_n \left(\zeta^2 - 1\right)^1$

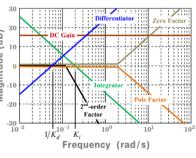

- Overdamped system: distinct real poles, $\zeta > 1$
- Critically damped system: repeated real poles, $\zeta = 1$
- Underdamped system: conjugate complex poles. $0 < \zeta < 1$ • Undamped system; conjugate imaginary poles, $\zeta = 0$

Blue stuff:
$$\sin{(\omega_0 t)} u(t) : + \frac{j}{4} \left[\delta(f+f_0) - \delta(f-f_0) \right]$$

$\cos(\omega_0 t) u(t) : + \frac{1}{4} \left[\delta(f + f_0) + \delta(f - f_0) \right]$ Chapter 8

- 1. $\tilde{H}(s) = K_{dc}$: DC gain (constant)
- 3. $\tilde{H}(s) = K_i/s$: integrator with gain K_i
- h(t) will not "blow up" and become unbounded, but 4. $\tilde{H}(s) = s/z_m + 1$: zero factor with unity DC gain (b) Un-aliased spectral images $(f_c > 1.5B)$ $(\tilde{H}(0) = 1)$
 - 5. $\tilde{H}(s) = \frac{1}{s/p_n+1}$: pole factor with unity DC gain
 - 6. $\tilde{H}(s) = \frac{\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2}$: 2nd-order factor with

High frequency:

Pole-zero excess
$$\times (-90^{\circ})$$
 (8.4a) requency:

(8.4b)

No. of $\int dt$ – No. of $\frac{d}{dt}$ $\times (-90^{\circ})$ Asymptotic slope of magnitude plot

High frequency: [Pole-zero excess]
$$\times$$
 (-20 dB/decade) (8.5a)

[Pole-zero excess]
$$\times$$
 (-20 dB/decade) (8.5a)
Low frequency:

No. of
$$\int dt$$
 No. of $\frac{d}{dt}$ \times (-20 dB/decade) (8.5a)

Chapter 9

9.1 Idealized LTI filters

Ideal Low-Pass Filter (LPF)

- Frequency response: $H(f) = A \operatorname{rect}\left(\frac{f}{2B}\right)$
- Impulse response: $h(t) = 2AB \operatorname{sinc}(2Bt)$

Ideal Band-Pass Filter (BPF)

• Frequency response:
$$H(f) = A \left[\operatorname{rect} \left(\frac{f + f_0}{B} \right) + \operatorname{rect} \left(\frac{f - f_0}{B} \right) \right]$$

 $h(t) = 2AB\operatorname{sinc}(Bt)\cos(2\pi f_0 t)$

9.2 Continuous-time Sampling and Reconstruction of Signals

Nyquist Sampling Theorem:

Nyquist sampling frequency / Nyquist rate $f_s = 2 f_m$ 9.3 Sampling Bandpass Signal below Nyquist

(a) Overlapping spectral images ($f_c > 0.5B$, symmetric about f_c and f_{-c}) $f_s = 2f_c/k; \quad k = 1, 2, \dots, |2f_c/B|$ (9.2a)

$$\frac{2f_c + B}{\frac{b-1}{b-1}} \le f_s \le \frac{2f_c - B}{\frac{b}{b-1}};$$

$$k=1,2,\ldots,\left\lfloor rac{2f_c-B}{2B}
ight
floor$$
